

I installed a game through the Linux command-line that I use to play when I was younger. After searching for the game I learned that there wasn't a download online that was supported on my Chromebook. After a little more research I found a video with instructions on the steps to take to install it through the command-line. The commands I used in the video are below:

```
sudo apt update
```

```
sudo apt install libnss3 kmenuedit
```

```
wget
```

```
https://fpdownload.macromedia.com/pub/flashplayer/updaters/32/flash\_player\_sa\_linux.x86\_64.tar.gz
```

```
tar -xf flash_player_sa_linux.x86_64.tar.gz
```

```
./flashplayer
```

```
kmenuedit
```

```
wget https://www.thewayoftheninja.org/Nv2-Linux.tar
```

```
tar -xf Nv2-Linux.tar
```
